Resumen: Este trabajo demuestra la siguiente conjetura: impulsos, retardos y condiciones no locales, bajo algunos supuestos, no destruyen algunas propiedades cualitativas del sistema planteado ya que son intrínsecas a él. Verificamos que la propiedad de controlabilidad es robusta bajo este tipo de perturbaciones para la ecuación de onda fuertemente amortiguada. Específicamente, demostramos que la capacidad de control interior aproximada de la ecuación de onda lineal fuertemente amortiguada no se destruye si agregamos impulsos, condiciones no locales y una perturbación no lineal con retraso en estado. Esto se hace mediante el uso de nuevas técnicas evitando teoremas de punto fijo empleado por A.E. Bashirov et al. En este caso el retraso nos ayuda a probar la capacidad de control aproximada de este sistema al retirar la solución de control a una curva fija en un corto intervalo de tiempo, y desde esta posición, podemos alcanzar una vecindad del estado final en el tiempo $\tau$ utilizando que la ecuación de onda lineal fuertemente amortiguada correspondiente es aproximadamente controlable en cualquier intervalo $\{t_0, \tau\}, 0 < t_0 < \tau$.

Palabras claves: controlabilidad aproximada interior, impulsos, ecuación de onda semilineal fuertemente amortiguada, retrasos, condiciones no locales, semigrupos fuertemente continuos.

Robustness of the controllability for the strongly damped wave equation under the influence of impulses, delays and nonlocal conditions

Abstract: This work proves the following conjecture: impulses, delays, and nonlocal conditions, under some assumptions, do not destroy some posed system qualitative properties since they are themselves intrinsic to it. We verified that the property of controllability is robust under this type of disturbances for the strongly damped wave equation. Specifically, we prove that the interior approximate controllability of linear strongly damped wave equation is not destroyed if we add impulses, nonlocal conditions and a nonlinear perturbation with delay in state. This is done by using new techniques avoiding fixed point theorems employed by A.E. Bashirov et al. In this case the delay help us to prove the approximate controllability of this system by pulling back the control solution to a fixed curve in a short time interval, and from this position, we are able to reach a neighborhood of the final state in time $\tau$ by using that the corresponding linear strongly damped wave equation is approximately controllable on any interval $\{t_0, \tau\}, 0 < t_0 < \tau$.

Keywords: interior approximate controllability, impulses, semilinear strongly damped wave equation, delays, nonlocal conditions, strongly continuous semigroups

1. Introduction

In this paper, we study the interior approximate controllability of the following strongly damped semilinear wave equations under the influence of impulses, delays and nonlocal conditions; without using fixed point Theorem

\[ w'' + \eta(-\Delta)^{1/2}w' + \gamma(-\Delta)w = 1 + f(t, w, w', w(t-s), \ldots, w(t-s), w'(t-s), \ldots, w'(t-s), \eta(t-s)) \quad \text{in } \Omega, \]

where

\[ w(t,s) = 0, \quad \text{on } \partial \Omega, \]

\[ w(x, s) + h_1(w(t_1, x), \ldots, w(t_\tau, x)) = \phi_1(x, s), \quad \text{in } \Omega, \gamma \]

\[ w'(t_1, x) + h_2(w'(t_1, x), \ldots, w'(t_\tau, x)) = \phi_2(x, s), \quad \text{in } \Omega, \gamma \]

\[ w'(t_1, x) = w'(t_1, x) + F_1(t_1, w(t_1, x), w'(t_1, x), w(t_1, x)) \quad k = 1, \ldots, p \]

In the space $Z^{1/2} = D((-\Delta)^{1/2}) \times L^2(\Omega)$ where $w' = \frac{\partial w}{\partial t}$, $w'' = \frac{\partial^2 w}{\partial t^2}$, $\Omega \subset \mathbb{R}^n$, $N \geq 1$ is a bounded domain, $\gamma$ and $\eta$ are positive numbers.
Along with Dirichlet boundary condition, where $\Delta$ denotes de Laplacian operator, $\Omega$ is a bounded domain in $\mathbb{R}^N$ ($N \geq 1$), $\partial \Omega$ denotes the boundary of $\Omega$, $\Omega_{\tau} = (0, \tau] \times \Omega$, $\Omega_{\tau/2} = (0, \tau/2] \times \partial \Omega$, $\Omega_{\tau/2} = \{ -\tau, 0 \} \times \Omega$, $\omega$ is an open nonempty subset of $\Omega$, $1_{\omega}$ denotes the characteristic function of the set $\omega$, the distributed control $u$ belongs to $L_2([0, \tau]; L_2(\Omega))$, $\phi_1 : [-r, 0] \times \Omega \to \mathbb{R}$, $i = 1,2$, are continuous functions, $0 < r_1 < \ldots < r_m < r$ are the delays and $0 < \tau_1 < \ldots < \tau_q < \tau$.

From now on, we shall assume the following hypotheses:

H1) The functions $I_k : [0, \tau] \times \mathbb{R} \times \mathbb{R} \times \mathbb{R} \to \mathbb{R}$, $k = 1, \ldots, p$, $f : [0, \tau] \times \mathbb{R} \times \mathbb{R}^m \times \mathbb{R}^m \times \mathbb{R} \to \mathbb{R}$, and $h_i : \mathbb{R}^q \to \mathbb{R}$, $i = 1,2$ are smooth enough, such that the above problem admits maitd solutions according with Leiva Hugo and Sundar P. (2017); Leiva Hugo (2018).

H2) The following estimates hold:

$$|f(t, x, t_0, x_0, \ldots, x_{\tau_m}, t_{\tau_1}, \ldots, t_{\tau_q})| \leq \rho \left( \left( \sum_{j=0}^{\infty} |x_j|^\rho_1 + |x_j|^\rho_2 \right) \right), \quad t, t_0, \ldots, t_{\tau_q} \in \mathbb{R}, \quad (3)$$

where $\rho : \mathbb{R}_+ \to (0, \infty)$ is a continuous and increasing function. In particular, $\rho$ could be given by

$$\rho(w) = a_0 w^\beta + b_0, \quad w > 0, \beta > 0, a_0, b_0 > 0.$$ 

Moreover,

$$y(t_k, x) = y(t_k^+, x) = \lim_{t \to t_k^+} y(t, x), \quad y(t_k^-, x) = \lim_{t \to t_k^-} y(t, x).$$

To set this problem, we shall choose the following natural Banach space:

$$P_{C_{1,p}}([-r, \tau]; Z^{1/2}) = \{ z : J = [0, \tau] \to Z^{1/2}; z \in C(J; Z^{1/2}); z(t_k^+, \cdot), z(t_k^-, \cdot) \text{ and } z(t_k^+) = z(t_k^-) \}$$

$$J' = [-r, \tau] \setminus \{ t_1, t_2, \ldots, t_p \} \text{ endowed with the norm } \| z \| = \sup_{t \in [-r, \tau]} \| z(t, \cdot) \|_{L^2(Z)} \text{, where } z = (w, v) \in \mathbb{R}^2 \text{ and }$$

$$\| z \|_{L^2(Z)} = \left( \int_{J'} \left( \| (-\Delta)^{1/2} w \|^2 + \| v \|^2 \right) dx \right)^{1/2}, \text{ for all } z \in Z^{1/2}.$$

Remark 1. It is clear that $P_{C_{1,p}}([-r, \tau]; Z^{1/2})$ is a closed linear subspace of the Banach space of all piecewise continuous functions $P_C([-r, \tau]; Z^{1/2})$ with the supreme norm, which implies that $P_{C_{1,p}}([-r, \tau]; Z^{1/2})$ is a Banach space with the same norm.

We note that the interior controllability of the following strongly damped wave equation without impulses, delays and nonlocal conditions

$$\begin{cases}
\ddot{w} + \eta (-\Delta)^{1/2} \dot{w} + \gamma (-\Delta) w = 1_u w(t, x), & \text{in } (0, \tau] \times \Omega, \\
w = 0, & \text{on } (0, \tau] \times \partial \Omega, \\
w(0, x) = w_0(x), \quad \dot{w}(0, x) = w_1(x), & \text{in } \Omega
\end{cases} \quad (4)$$

has been proved in Larez H., Leiva Hugo and Rebaza J. (2012), where the abstract formulation is done using fractional powered spaces, some ideas are taken from it to study this present problem. Finally, the approximate controllability of the system (1) follows from the approximate controllability of the linear system (4) in any interval of the form $[\tau - \delta, \tau]$, with $0 < \delta < \tau$, and using a new technique avoid fixed point theorems by applying in (Bashirov A.E. and Gahramanlou N. (2013)), (Bashirov et al. (2007)), (Bashirov A.E. and Mahmudov N.I. (1999)).

There are many practical examples of impulsive control systems, a chemical reactor system, a financial system with two state variables, the amount of money in a market and the savings rate of a central bank; and the growth of a population diffusing throughout its habitat modeled by a reaction-diffusion equation. One may easily visualize situations in these examples where abrupt changes such as harvesting, disasters and instantaneous stockking may occur. These problems are modeled by impulsive differential equations, and for more information see the monographs, (Lakshmikantham V., Bainov D. D. and Simeonov P.S. (1989)) and (Samolienko A. M. and Perestyuk N.A. (1995)).

The controllability of Impulsive Evolution Equations has been studied recently for several authors, but most them study the exact controllability only, to mention: (Chalishajar D. N. (2011)), studied the exact controllability of impulsive partial neutral functional differential equations with infinite delay and (Selvi S. and Mallika Arjunan M. (2012)) studied the exact controllability for impulsive differential systems with finite delay.

To our knowledge, there are a few works on approximate controllability of impulsive semilinear evolution equations, to mention: (Chen L. and Li G (2010)) studied the Approximate controllability of impulsive differential equations with nonlocal conditions, using measure of noncompactness and Monch’s fixed point theorem, and assuming that the nonlinear term $f(t, z)$ does not depend on the control variable.

Recently, in Leiva Hugo (2014a,b); Leiva Hugo and Merentes N. (2015); Leiva Hugo (2015) the approximate controllability of semilinear evolution equations with impulses has been studied applying Rothe’s Fixed Point Theorem. Also, there are many papers on evolution equations with impulses and delay or with impulses and nonlocal conditions or with local conditions and delays, where not only the controllability is studied, but also other aspects are studied, such as the existence of mild solutions, synchronization, stability, etc. To mention, we have the following references: Chalishajar D. N. (2011); Chen L. and Li G (2010); Chiu K. and Li T. (2019); Guevara C. and Leiva H. (2016); Guevara C. and Leiva H. (2017); Jiang C., Zhang F. and Li Tongxing (2018); Leiva Hugo and Rojas Raul (2016); Li Tongxing, Pintus Nicola and Vighialoro Giuseppe (2019); Liang Jin, Liu James H. and Xiao Ti-Jun (2009); Qina Haiyong et al. (2017); Quin Haiyong et al. (2017); Selvi S. and Mallika Arjunan M. (2012).
2. Abstract Formulation of the Problem.

In this section, we choose a Hilbert space where system (1) can be written as an abstract differential equation; to this end, we shall use the following notations:

Let $X = U = L^2(|\Omega|) = L^2(|\Omega|, \mathbb{R})$ and consider the linear unbounded operator $A : D(A) \subset X \to X$ defined by

$$A\varphi = -\Delta \varphi, \quad \text{where } D(A) = H^2(\Omega, \mathbb{R}) \cap H^1_0(\Omega, \mathbb{R}).$$

The fractional powered spaces $X^\alpha$ (see details in Larez H., Leiva Hugo and Rebaza J. (2012)) are given by

$$X^\alpha = D(A^\alpha) = \{ x \in X : \sum_{n=1}^\infty \lambda_n^{2\alpha} \| E_n x \|^2 < \infty \},$$

where $\{ E_j \}$ is a family of complete orthogonal projections in $X$; and for the Hilbert space $Z^\alpha = X^\alpha \times X$ the corresponding norm is

$$\| (w, v) \|_{Z^\alpha} = \| w \|_{X^\alpha} + \| v \|_2.$$

Proposition 1. Given $j \geq 1$, the operator $P_j : Z^\alpha \to Z^\alpha$ defined by

$$(5) \quad P_j = \begin{bmatrix} E_j & 0 \\ 0 & E_j \end{bmatrix}$$

is a continuous (bounded) orthogonal projections in the Hilbert space $Z^\alpha$.

Hence, the equation (1) can be written as an abstract second order ordinary differential equation in space $X$ as

$$w'' + \eta A^\alpha \omega + \gamma_2 w = B_\omega u + f(t, w(t), w'(t), w''(t), \ldots);$$

where

$$(6) \quad f^* : [0, T] \times Z^\alpha \times \mathcal{C}^n([-r, 0]; Z^\alpha/2^\alpha) \times \mathcal{C}^n([-r, 0]; Z^\alpha/2) \times U \to X$$

with $u \in \mathcal{C}^n([-r, 0]; Z^\alpha/2)$ and $\varepsilon > 0$, there exists $u \in \mathcal{C}^n([0, T]; X) \cup \mathbb{R}$ such that the solution $z(t)$ of (1) corresponding to $u$ verifies:

$$z(0) = 0, \quad \| z(\tau) - z(t) \|_{Z^\alpha/2} < \varepsilon.$$
A_j = R_jP_j, \quad R_j = \begin{bmatrix} 0 & 1 \\ -\gamma \lambda_j & -\eta \lambda_j^{1/2} \end{bmatrix}, \quad j \geq 1.

Moreover, $e^{A_j t} = e^{R_j t} P_j$, the eigenvalues of $R_j$ are

$$\lambda = -i_j^{1/2} \left( \frac{\eta \pm \sqrt{\eta^2 - 4\gamma}}{2} \right), \quad j = 1, 2, \ldots,$$

and

$$A_j^* = R_j P_j, \quad R_j^* = \begin{bmatrix} 0 & -1 \\ \gamma \lambda_j & -\eta \lambda_j^{1/2} \end{bmatrix}.$$

where

$$\beta = \lambda_1^{1/2} \min \left\{ Re \left( \frac{\eta \pm \sqrt{\eta^2 - 4\gamma}}{2} \right) \right\}.$$

3. Approximate Controllability of the Linear System

In this section, we shall characterize the approximate controllability of the linear system. To this end, for all $z_0 \in Z_1$ and $u \in L^2(0, \tau; U)$ the initial value problem

$$\begin{cases} z'(t) = A_z(t) + B_0 u(t), \quad z \in Z^{1/2}, \\
z(t_0) = z_0, \end{cases} \quad (10)$$

admits only one mild solution given by

$$z(t) = T(t-t_0)z_0 + \int_{t_0}^{t} T(t-s)B_0 u(s)ds; \ t \in [t_0, \tau], \ 0 \leq t_0 \leq \tau. \quad (11)$$

Definition 2. For the system (10) we define the following concept: The controllability map (for $\tau > 0$) $G_{t_0} : L^2([\tau - \delta, \tau]; U) \longrightarrow Z^{1/2}$ is defined by

$$G_{t_0}u = \int_{\tau-\delta}^{\tau} T(t-s)B_0 u(s)ds, \quad (12)$$

whose adjoint operator $G_{t_0}^*$ is

$$G_{t_0}^* : Z^{1/2} \longrightarrow L^2([\tau - \delta, \tau]; U)$$

is given by

$$(G_{t_0}^* z)(s) = B_0^* T(t)z, \quad \forall s \in [0, \delta], \ \forall z \in Z^{1/2}. \quad (13)$$

The Gramian controllability operator is defined as:

$$Q_{t_0} = G_{t_0} G_{t_0}^* = \int_{\tau-\delta}^{\tau} T(t-s)B_0 B_0^* T^*(t-s)u(s)ds. \quad (14)$$

The following lemma holds in general for a linear bounded operator $G : \mathcal{H} \longrightarrow \mathcal{Z}$ between Hilbert spaces $\mathcal{H}$ and $\mathcal{Z}$ (see Curtain R.F. and Pritchard A.J. (1978), Curtain R.F. and Zwart H.J. (1995) and Leiva Hugo, Merentes N. and Sanchez J. (2012)).

Lemma 1. The following statements are equivalent to the approximate controllability of the linear system (10) on $[\tau - \delta, \tau]$

1. $\text{Rang}(G_{t_0}) = Z^{1/2}$.
2. $\ker(G_{t_0}^*) = 0$.
3. $(Q_{t_0} z, z) > 0, \ z \neq 0$ in $Z^{1/2}$.

The following Theorem is a characterization of the approximate controllability of the system (10):

Theorem 1. (see Bashirov et al. (2007), Bashirov A.E. and Mahmudov N.I. (1999), Curtain R.F. and Pritchard A.J. (1978), Curtain R.F. and Zwart H.J. (1995) and Leiva Hugo, Merentes N. and Sanchez J. (2012)) The system (10) is approximately controllable on $[0, \tau]$ if, and only if, any of the following conditions hold:

1. $\lim_{\alpha \to 0^+} \alpha (\alpha I + Q_{t_0}^*)^{-1} z = 0$.
2. For all $z \in Z^{1/2}$ we have $G_{t_0} u_\alpha = z - \alpha (\alpha I + Q_{t_0}^*)^{-1} z$, where

$$u_\alpha = G_{t_0}^* (\alpha I + Q_{t_0}^*)^{-1} z, \ \alpha \in (0, 1].$$

3. Moreover, if we consider for each $v \in L^2([\tau - \delta, \tau]; U)$, the sequence of controls given by

$$u_\alpha = G_{t_0}^* (\alpha I + Q_{t_0}^*)^{-1} z + (v - G_{t_0}^* (\alpha I + Q_{t_0}^*)^{-1} G_{t_0} v), \ \alpha \in (0, 1]$$

we get that:

$$G_{t_0} u_\alpha = z - \alpha (\alpha I + Q_{t_0}^*)^{-1} (z - G_{t_0} v)$$

and

$$\lim_{\alpha \to 0} G_{t_0} u_\alpha = z,$$

with the error $E_{t_0} z$ of this approximation is given by

$$E_{t_0} z = \alpha (\alpha I + Q_{t_0}^*)^{-1} (z + G_{t_0} v), \ \alpha \in (0, 1].$$

Remark 2. The Theorem 1 implies that the family of linear operators $\Gamma_{t_0} : Z^{1/2} \longrightarrow L^2([\tau - \delta, \tau]; U)$ defined for $0 \leq \alpha \leq 1$ by

$$\Gamma_{t_0} z = G_{t_0}^* (\alpha I + Q_{t_0}^*)^{-1} z,$$

satisfies the following relation

$$\lim_{\alpha \to 0} G_{t_0} \Gamma_{t_0} = I$$

in the strong topology.

Since the controllability of the linear system (10) was proved in Carrasco A., Leiva H. and Sanchez J.L. (2013), on $[0, \tau]$ for all $\tau > 0$, we get the following characterization for the approximate controllability of (10):

Lemma 2. $Q_{t_0} > 0$ if, and only if, the linear system (10) is controllable on $[\tau - \delta, \tau]$. Moreover, given an initial state $y_0$ and a final state $Z^{1/2}$ we can find a sequence of controls $\{u_\alpha^S\}_{0 < \alpha \leq 1} \subset L^2(\tau - \delta, \tau; U)$

$$u_\alpha = G_{t_0}^* (\alpha I + G_{t_0} G_{t_0}^*)^{-1} (z_1 - T(t)y_0), \ \alpha \in (0, 1],$$

such that the solutions $y(t) = y(t, \tau - \delta, y_0, u_\alpha^S)$ of the initial value problem

$$\begin{cases} y' = Ay + B_0 u_\alpha(t), \quad y \in Z^{1/2}, \quad t > 0, \\
y(\tau - \delta) = y_0. \end{cases} \quad (15)$$

Revista Politécnica - Octubre 2019, Vol. 44, No. 1
satisfies
\[ \lim_{\alpha \to 0^+} y(\tau, \tau - \delta, y_0, u_\alpha) = z_1. \]

\[ e.i., \]
\[ \lim_{\alpha \to 0^+} y(\tau) = \lim_{\alpha \to 0^+} \left\{ T(\delta)y_0 + \int_{\tau - \delta}^{\tau} T(\tau - s)Bu_\alpha(s)\,ds \right\} = z_1. \]

4. The System with Impulses, Delays and Nonlocal Conditions

In this section, we shall prove the main result of this paper, the interior approximate controllability of the semilinear strongly damped wave equation with impulses, delays and nonlocal conditions given by (1), which is equivalent to prove the approximate controllability of the system (7). To this end, for all \( \phi \in C \) and \( u \in C([0, \tau]; U) \) the initial value problem, according with the recent work from Leiva Hugo and Sundar P. (2017); Leiva Hugo (2018),

\[
\begin{align*}
\dot{z} &= Az + B_0u + \mathcal{F}(t, z(t), \omega(t)), \quad t \in (0, \tau], \\
(z(s) + g(z_0, z_2, \ldots, z_k, u)) = \varphi(s), \quad s \in [-\tau, 0], \\
z(t^+) = z(t^-) + \mathcal{J}_k(t, z(t), u(t)), & \quad k = 1, 2, 3, \ldots, p.
\end{align*}
\]

admits only one mild solution \( z \in PC_{1, T_p}([-\tau, \tau]; \mathbb{R}^{1/2}) \) given by

\[
z(t) = \begin{cases}
T(t)\phi(0) - T(t)(g(z_0, \ldots, z_k)(0) + \int_0^T T(t - s)B_0u(s)\,ds) \\
+ \int_0^T T(t - s)f(s, z(s), \omega(s), \omega(t) - r), \omega(t) - r), \ldots, \omega(t) - r), u(s)\,ds \\
+ \sum_{0 < \tau < t} T(t - \tau)\mathcal{J}_k(t, z(t), u(t)), & t \in [0, \tau], \\
(\varphi(z_0, \ldots, z_k))(t) = \varphi(t), & t \in [-\tau, 0].
\end{cases}
\]

Now, we are ready to present and prove the main result of this paper, which is the interior approximate controllability of the semilinear strongly damped wave equation with impulses, delays and nonlocal conditions (16).

Theorem 2. If the functions \( f, I_k, h \) are smooth enough, condition (8) holds, and since the linear system (10) is approximately controllable on any interval \( [\tau - \delta, \tau] \), \( 0 < \delta < \tau \), then system (16) is approximately controllable on \( [0, \tau] \).

Demostración. Given \( \phi \in C \), a final state \( z_1 \) and \( \varepsilon > 0 \), we want to find a control \( u^\delta \in L^2(0, \tau; U) \) steering the system to \( z \) on \( [\tau - \delta, \tau] \). Precisely, for \( 0 < \delta < \min\{\tau - T_p, r\} \), small enough, there exists control \( u^\delta \in L^2(0, \tau; U) \) such that corresponding of solutions \( z^\delta \) of (16) satisfies

\[ \left\| z^\delta(\tau) - z_1 \right\| < \varepsilon. \]

In fact, we consider any fixed control \( u \in L^2(0, \tau; U) \) and the corresponding solution \( z(t) = z(t, 0, \phi, u) \) of the problem (16). For \( 0 < \delta < \min\{\tau - T_p, r\} \), small enough, we define the control \( u^\delta \in L^2(0, \tau; U) \) as follows

\[ u^\delta(t) = \begin{cases}
u(t), & 0 \leq t \leq \tau - \delta, \\
\nu^\delta(t), & \tau - \delta < t \leq \tau.
\end{cases}\]

where

\[ \nu^\delta(t) = B_0^*T^\delta(t - r)\left(\alpha T + G_{0\alpha}G_{r\alpha}^{-1}\right)^{-1}(\tau(\delta)z(\tau - \delta), \tau - \delta < t \leq \tau. \]

Since \( 0 < \delta < \tau - t_p \), then \( \tau - \delta > t_p \), the corresponding solution \( z^\delta(t) \) of the problem (16) at time \( \tau \) can be written as follows:

\[ z^\delta(\tau) = T(\tau)\phi(0) - T(\tau)(g(z_0, \ldots, z_k)(0)) + \int_0^\tau T(\tau - s)B_0u(s)\,ds \\
+ \int_0^{\tau - \delta} T(\tau - s)f(s, z^\delta(s), z^\delta(r), z^\delta(\tau - r), \ldots, z^\delta(\tau - r), u(s)) \\
+ \sum_{0 < \tau < \tau} T(\tau - \tau)\mathcal{J}_k(t, \mathcal{J}_k(t, u(t), u(t))).
\]

So,

\[ T(\tau)z(\tau) - T(\tau)\phi(0) - T(\tau)(g(z_0, \ldots, z_k)(0)) \\
+ \int_0^{\tau - \delta} T(\tau - s)B_0u(s)\,ds \\
+ \int_0^{\tau - \delta} T(\tau - s)f(s, z^\delta(s), z^\delta(r), z^\delta(\tau - r), \ldots, z^\delta(\tau - r), u(s)) \\
+ \sum_{0 < \tau < \tau} T(\tau - \tau)\mathcal{J}_k(t, \mathcal{J}_k(t, u(t), u(t))).
\]

The corresponding solution

\[ y^\delta(t) = y(t, \tau - \delta, z(\tau - \delta), \nu^\delta) \]

of the initial value problem (10) at time \( \tau \), for the control \( \nu^\delta \) and the initial condition \( z_0 = z(\tau - \delta) \), is given by:

\[ y^\delta(t) = T(\tau)z(\tau - \delta) + \int_0^\tau T(\tau - s)B_0u(s)\,ds,
\]

and from Lemma 2, we get a solution of the linear initial value problem (10) such that

\[ \|y^\delta(\tau) - z_1\| < \frac{\varepsilon}{2}. \]

Therefore,

\[ \|y^\delta(t) - z_1\| < \frac{\varepsilon}{2} + \int_0^\tau \|T(\tau - s)\|\|f(s, z^\delta(s), z^\delta(\tau - r), \ldots, z^\delta(\tau - r), u(s))\|\,ds. \]

Now, since \( 0 < \delta < r \) and \( \tau - \delta \leq s \leq \tau \), then \( s - r \leq \tau - r < \tau - \delta \) and

\[ z^\delta(s - r) = z(s - r). \]

Hence, there exists \( \delta \) small enough such that \( 0 < \delta < \min\{r, \tau - T_p\} \) and

\[ \|z^\delta(t) - z_1\| < \frac{\varepsilon}{2} + \int_0^\tau \|T(\tau - s)\|\|f(s, z^\delta(s), z^\delta(\tau - r), \ldots, z^\delta(\tau - r), u(s))\|\,ds < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon. \]

This completes the proof of the Theorem.
5. Final Remark

Our methodology is simple and can be applied to those second order diffusive processes with impulses, delays and nonlocal conditions like some control system governed by partial differential equations. For example, the Benjamin -Bona-Mahoney Equation with impulses, delays and nonlocal conditions, the beam equations with impulses, delays and nonlocal conditions, etc.

Moreover, some of these particular problems can be formulated in a more general setting. Indeed, we can consider the following equation with impulses, delays and nonlocal conditions, the beam conditions like some control system governed by partial differential processes with impulses, delays and nonlocal conditions. Our methodology is simple and can be applied to those second order differential processes with impulses, delays and nonlocal conditions.

In this work, we prove the interior approximate controllability of the strongly damped equation with impulses, delays and nonlocal conditions by using a new technique avoiding fixed point theorems applying by Bashirov A.E. and Gahramanlou N. (2013), Bashirov et al. (2007), Bashirov A.E. and Mahmudov N.I. (1999). After that, we present some open problems and a possible general framework to study the controllability of semilinear second order diffusion process in Hilbert spaces with impulses, delays and nonlocal conditions. The novelty in this paper is that the literature of control systems with impulses, delays and nonlocal conditions is very short, there are a very few numbers of papers on systems with impulses, delays and nonlocal conditions simultaneously. That is to say, control systems governed by partial differential equations with impulses, delays and nonlocal conditions have not been studied much.

ACKNOWLEDGEMENTS

We would like to thank the anonymous referees for their suggestions and comment that help us to improve this paper.
